CONTENTS

Abstract—This manual provides a simple introduction to digital signal processing.

1 SOFTWARE INSTALLATION

Run the following commands

```
sudo apt-get update
sudo apt-get install libffi-dev libsndfile1 python3
    -scipy python3-numpy python3-matplotlib
sudo pip install cffi pysoundfile
```

2 DIGITAL FILTER

2.1 Download the sound file from

```
wget https://github.com/yashrajput22/EE3900
    -22/blob/master/codes/Section-2/
    Sound_Noise.wav
```

2.2 You will find a spectrogram at <https://academo.org/demos/spectrum-analyzer>. Upload the sound file that you downloaded in Problem ?? in the spectrogram and play. Observe the spectrogram. What do you find?

Solution: There are a lot of yellow lines between 440 Hz to 5.1 KHz. These represent the synthesizer key tones. Also, the key strokes are audible along with background noise.

2.3 Write the python code for removal of out of band noise and execute the code.

Solution:

```
import soundfile as sf
from scipy import signal

#read .wav file
input_signal,fs = sf.read("Sound_Noise.wav")

#sampling frequency of Input signal
sampl_freq=fs
# print("Sample Frequency ",sampl_freq)
```

```
#order of the filter
order=4
#cutoff frequency 4kHz
cutoff_freq=4000.0
#digital frequency
Wn=2*cutoff_freq/sampl_freq
# b and a are numerator and
    denominator polynomials respectively
b, a = signal.butter(order,Wn, 'low')
#filter the input signal with butterworth filter
# output_signal = signal.filtfilt(b, a,
    input_signal)
output_signal = signal.lfilter(b, a,
    input_signal)
#write the output signal into .wav file
sf.write('Sound_With_ReducedNoise.wav',
    output_signal, fs)
```

2.4 The output of the python script in Problem ?? is the audio file Sound_With_ReducedNoise.wav. Play the file in the spectrogram in Problem ??. What do you observe?

Solution: The key strokes as well as background noise is subdued in the audio. Also, the signal is blank for frequencies above 5.1 kHz.

3 DIFFERENCE EQUATION

3.1 Let

$$x(n) = \left\{ \underset{\uparrow}{1}, 2, 3, 4, 2, 1 \right\} \quad (3.1)$$

Sketch $x(n)$.

Solution:

```
import numpy as np
import matplotlib.pyplot as plt

x=np.array([1.0,2.0,3.0,4.0,2.0,1.0])

plt.stem(range(0,len(x)),x)
plt.ylabel("$x(n)$")
```

```
plt.xlabel('$n$')
plt.grid()
plt.show()
```

The above code yields

3.2 Let

$$y(n) + \frac{1}{2}y(n-1) = x(n) + x(n-2),$$

$$y(n) = 0, n < 0 \quad (3.2)$$

Sketch $y(n)$.

Solution:

```
import numpy as np
import matplotlib.pyplot as plt
#If using termux
import subprocess
import shlex
#end if

x=np.array([1.0,2.0,3.0,4.0,2.0,1.0])
k = 20
y = np.zeros(20)

y[0] = x[0]
y[1] = -0.5*y[0]+x[1]

for n in range(2,k-1):
    if n < 6:
        y[n] = -0.5*y[n-1]+x[n]+x[n-2]
    elif n > 5 and n < 8:
        y[n] = -0.5*y[n-1]+x[n-2]
    else:
        y[n] = -0.5*y[n-1]
print(y)
```

```
#subplots
plt.subplot(2, 1, 1)
plt.stem(range(0,6),x)
plt.title('Digital_Filter_Input-Output')
plt.ylabel('$x(n)$')
plt.grid()# minor
```

```
plt.subplot(2, 1, 2)
plt.stem(range(0,k),y)
plt.xlabel('$n$')
plt.ylabel('$y(n)$')
plt.grid()# minor
```

```
#If using termux
# plt.savefig('..figs/xnyn.pdf')
# plt.savefig('..figs/xnyn.eps')
# subprocess.run(shlex.split("termux-open ../figs/xnyn.pdf"))
#else
plt.show()
```

3.3 Repeat the above exercise using a C code.

Solution: The following C code generates data and saves it to a .dat file

```
#include <stdlib.h>
#include <stdio.h>
#define k 20

int main(){
    double x[6]={1,2,3,4,2,1};
    double y[k]={0};
    y[0]=x[0];
    y[1]=x[1]- 0.5*y[0];
    for(int i=2;i<k;i++){
```

```

    if (i<6)
        y[i]=-0.5*y[i-1] + x[i]+x[i-2];
    else if(i<8)
        y[i]=-0.5*y[i-1] + x[i-2];
    else
        y[i]=-0.5*y[i-1];
}
int axes_x[sizeof(x)/sizeof(int)]=0;
int axes_y[k]={0};

FILE* fpy;
fpy=fopen("3_3_data_y.dat","w");
for(int i=0;i<k;i++){
    fprintf(fpy,"%f\n",y[i]);
}
fclose(fpy);
FILE* fpx;
fpx=fopen("3_3_data_x.dat","w");
for(int i=0;i<6;i++){
    fprintf(fpx,"%f\n",x[i]);
}
fclose(fpx);
return 0;
}

```

The following Python code sketches $x(n)$ and $y(n)$

```

import numpy as np
import matplotlib.pyplot as plt

y=np.loadtxt('3_3_data_y.dat',dtype="double")
x=np.loadtxt('3_3_data_x.dat',dtype="double")

plt.subplot(2,1,1)
plt.stem(range(0,len(x)),x)
plt.title("Digital_Filter_Input-Output")
plt.ylabel("$x(n)$")
plt.grid()

plt.subplot(2,1,2)
plt.stem(range(0,len(y)),y)
plt.ylabel("$y(n)$")
plt.xlabel("$n$")
plt.grid()
plt.show()

```

4 Z-TRANSFORM

4.1 The Z-transform of $x(n)$ is defined as

$$X(z) = \mathcal{Z}\{x(n)\} = \sum_{n=-\infty}^{\infty} x(n)z^{-n} \quad (4.1)$$

Show that

$$\mathcal{Z}\{x(n-1)\} = z^{-1}X(z) \quad (4.2)$$

and find

$$\mathcal{Z}\{x(n-k)\} \quad (4.3)$$

Solution: From (??),

$$\begin{aligned} \mathcal{Z}\{x(n-1)\} &= \sum_{n=-\infty}^{\infty} x(n-1)z^{-n} \\ &= \sum_{n=-\infty}^{\infty} x(n)z^{-n-1} = z^{-1} \sum_{n=-\infty}^{\infty} x(n)z^{-n} \end{aligned} \quad (4.4)$$

resulting in (??). Similarly, it can be shown that

$$\mathcal{Z}\{x(n-k)\} = z^{-k}X(z) \quad (4.6)$$

4.2 Obtain $X(z)$ for $x(n)$ defined in problem ??.

Solution:

$$\begin{aligned} Z(x(n)) &= \sum_{n=-\infty}^{\infty} x(n)z^{-n} \\ &= x(0)z^0 + x(1)z^{-1} + x(2)z^{-2} + x(3)z^{-3} + \end{aligned} \quad (4.7)$$

$$\begin{aligned} &x(4)z^{-4} + x(5)z^{-5} \\ &= 1 + 2z^{-1} + 3z^{-2} + 4z^{-3} + 2z^{-4} + z^{-5} \end{aligned} \quad (4.9)$$

4.3 Find

$$H(z) = \frac{Y(z)}{X(z)} \quad (4.10)$$

from (??) assuming that the Z-transform is a linear operation.

Solution:

Applying (??) in (??),

$$Y(z) + \frac{1}{2}z^{-1}Y(z) = X(z) + z^{-2}X(z) \quad (4.11)$$

$$\Rightarrow \frac{Y(z)}{X(z)} = \frac{1 + z^{-2}}{1 + \frac{1}{2}z^{-1}} \quad (4.12)$$

4.4 Find the Z transform of

$$\delta(n) = \begin{cases} 1 & n = 0 \\ 0 & \text{otherwise} \end{cases} \quad (4.13)$$

and show that the Z-transform of

$$u(n) = \begin{cases} 1 & n \geq 0 \\ 0 & \text{otherwise} \end{cases} \quad (4.14)$$

is

$$U(z) = \frac{1}{1 - z^{-1}}, \quad |z| > 1 \quad (4.15)$$

Solution: It is easy to show that

$$\delta(n) \stackrel{Z}{\rightleftharpoons} 1 \quad (4.16)$$

and from (??),

$$U(z) = \sum_{n=0}^{\infty} z^{-n} \quad (4.17)$$

$$= \frac{1}{1 - z^{-1}}, \quad |z| > 1 \quad (4.18)$$

using the formula for the sum of an infinite geometric progression.

4.5 Show that

$$a^n u(n) \stackrel{Z}{\rightleftharpoons} \frac{1}{1 - az^{-1}} \quad |z| > |a| \quad (4.19)$$

Solution:

$$\mathcal{Z}\{a^n u(n)\} = \sum_{n=-\infty}^{\infty} a^n u(n) z^{-n} \quad (4.20)$$

$$= \sum_{n=0}^{\infty} u(n) (az^{-1})^n \quad (4.21)$$

$$= \sum_{n=0}^{\infty} (az^{-1})^n, \quad |az^{-1}| < 1 \quad (4.22)$$

$$(4.23)$$

$$= \frac{1}{1 - az^{-1}}, \quad |a| < |z| \quad (4.24)$$

using the formula for the sum of an infinite geometric progression.

4.6 Let

$$H(e^{j\omega}) = H(z = e^{j\omega}). \quad (4.25)$$

Plot $|H(e^{j\omega})|$. Comment. $H(e^{j\omega})$ is known as the *Discrete Time Fourier Transform* (DTFT) of $x(n)$.

Solution: The graph is symmetric and periodic. It achieves a high of value 4 and a minimum value between 0 - 0.5. It is bounded between (0, 4) with period of 2π

$$H(e^{j\omega}) = \frac{1 + e^{-2j\omega}}{1 + \frac{e^{-j\omega}}{2}} \quad (4.26)$$

$$\Rightarrow |H(e^{j\omega})| = \frac{|1 + e^{-2j\omega}|}{|1 + \frac{e^{-j\omega}}{2}|} \quad (4.27)$$

$$= \frac{|1 + e^{2j\omega}|}{|e^{2j\omega} + \frac{e^{j\omega}}{2}|} \quad (4.28)$$

$$= \frac{|1 + \cos 2\omega + j \sin 2\omega|}{|e^{j\omega} + \frac{1}{2}|} \quad (4.29)$$

$$= \frac{|4 \cos^2(\omega) + 4j \sin(\omega) \cos(\omega)|}{|2e^{j\omega} + 1|} \quad (4.30)$$

$$= \frac{|4 \cos(\omega)| |\cos(\omega) + j \sin(\omega)|}{|2 \cos(\omega) + 1 + 2j \sin(\omega)|} \quad (4.31)$$

$$\therefore |H(e^{j\omega})| = \frac{|4 \cos(\omega)|}{\sqrt{5 + 4 \cos(\omega)}} \quad (4.32)$$

The following code plots $|H(e^{j\omega})|$

```
import numpy as np
```

```

import matplotlib.pyplot as plt

#DTFT
def H(z):
    num = np.polyval([1,0,1],z**(-1))
    den = np.polyval([0.5,1],z**(-1))
    H = num/den
    return H

#Input and Output
omega = np.linspace(-3*np.pi,3*np.pi,100)

#subplots
plt.plot(omega, abs(H(np.exp(1j*omega))))
plt.title('Filter_Frequency_Response')
plt.xlabel('$\omega$')
plt.ylabel('$|H(e^{j\omega})|$')
plt.grid()# minor

plt.show()

```

Fig. 4.6: $h(n)$ as the inverse of $H(z)$

Solution:

$$H(e^{j\omega}) = \sum_{n=-\infty}^{\infty} h(n) e^{-j\omega n} \quad (4.33)$$

$$\int_{-\pi}^{\pi} H(e^{j\omega}) e^{j\omega k} d\omega = \sum_{n=-\infty}^{\infty} h(n) \int_{-\pi}^{\pi} e^{-j\omega n} e^{j\omega k} d\omega \quad (4.34)$$

$$(4.35)$$

$$\int_{-\pi}^{\pi} e^{j\omega(n-k)} d\omega = \begin{cases} 2\pi & n = k \\ 0 & \text{otherwise} \end{cases} \quad (4.36)$$

$$\int_{-\pi}^{\pi} H(e^{j\omega}) e^{j\omega k} d\omega = h(n) 2\pi \quad (4.37)$$

$$\int_{-\pi}^{\pi} H(e^{j\omega}) e^{j\omega k} d\omega = 2\pi h(n) \quad (4.38)$$

$$\frac{1}{2\pi} \int_{-\pi}^{\pi} H(e^{j\omega}) e^{j\omega k} d\omega = h(n) \quad (4.39)$$

5 IMPULSE RESPONSE

5.1 Using long division, find

$$h(n), \quad n < 5 \quad (5.1)$$

for $H(z)$ in (??).

Solution:

$$H(z) = \frac{1 + z^{-2}}{1 + \frac{1}{2}z^{-1}} \quad (5.2)$$

Let $z^{-1} = x$, then, by polynomial long division we get

4.7 Express $h(n)$ in terms of $H(e^{j\omega})$.

From (??) we know that

$$h(n) = \left(-\frac{1}{2}\right)^n u(n) + \left(-\frac{1}{2}\right)^{n-2} u(n-2) \quad (5.18)$$

Implies we can write that

$$h(n) = \begin{cases} 0 & , n < 0 \\ \left(-\frac{1}{2}\right)^n & , 0 \leq n < 2 \\ 5\left(-\frac{1}{2}\right)^n & , n \geq 2 \end{cases} \quad (5.19)$$

A sequence is said to be bounded when

$$|x_n| \leq M, \forall n \in \mathcal{N} \quad (5.20)$$

Now consider (??),

For $n < 0$,

$$|h(n)| \leq 0 \quad (5.21)$$

For $0 \leq n < 2$,

$$|h(n)| = \left(\frac{1}{2}\right)^n \quad (5.22)$$

$$\Rightarrow |h(n)| \leq 1 \quad (5.23)$$

For $n \geq 2$,

$$|h(n)| = 5\left(\frac{1}{2}\right)^n \quad (5.24)$$

$$\Rightarrow |h(n)| \leq 5 \quad (5.25)$$

From above we can say that,

$$M = \max\{0, 1, 5\} \quad (5.26)$$

$$= 5 \quad (5.27)$$

Therefore since M exists and is a real value, we can say that $h(n)$ is bounded.

5.4 Convergent? Justify using the ratio test.

Solution:

Yes, it is convergent. We can clearly see in the plot it is not tending to infinite and remain finite.

For large n , we see that

$$h(n) = \left(-\frac{1}{2}\right)^n + \left(-\frac{1}{2}\right)^{n-2} \quad (5.28)$$

$$= \left(-\frac{1}{2}\right)^n (4 + 1) = 5\left(-\frac{1}{2}\right)^n \quad (5.29)$$

$$\Rightarrow \left|\frac{h(n+1)}{h(n)}\right| = \frac{1}{2} \quad (5.30)$$

and therefore, $\lim_{n \rightarrow \infty} \left|\frac{h(n+1)}{h(n)}\right| = \frac{1}{2} < 1$. Hence, we see that $h(n)$ converges.

The following code plots

```
wget https://github.com/yashrajput22/EE3900
-22/blob/master/codes/Section-5/5_2.py
```

Fig. 5.4: $h(n)$ as the inverse of $H(z)$

5.5 The system with $h(n)$ is defined to be stable if

$$\sum_{n=-\infty}^{\infty} h(n) < \infty \quad (5.31)$$

Is the system defined by (??) stable for the impulse response in (??)?

Solution: By using $h(n)$ from 5.3

$$h(n) = \left(-\frac{1}{2}\right)^n u(n) + \left(-\frac{1}{2}\right)^{n-2} u(n-2) \quad (5.32)$$

$$= \sum_{n=-\infty}^{\infty} \left(-\frac{1}{2}\right)^n u(n) + \sum_{n=-\infty}^{\infty} \left(-\frac{1}{2}\right)^{n-2} u(n-2) \quad (5.33)$$

$$= \sum_{n=-\infty}^{\infty} \left(-\frac{1}{2}\right)^n u(n) + \sum_{n=-\infty}^{\infty} \left(-\frac{1}{2}\right)^{n-2} u(n-2) \quad (5.34)$$

$$= \sum_{n=-\infty}^{\infty} \left(-\frac{1}{2}\right)^n + \sum_{n=-\infty}^{\infty} \left(-\frac{1}{2}\right)^{n-2} \quad (5.35)$$

$$= \frac{2}{3} + \frac{2}{3} < \infty \quad (5.36)$$

$$= \frac{2}{3} + \frac{2}{3} < \infty \quad (5.37)$$

5.6 Verify the above result using a python code.

Solution: The following code computes and plots at each n . We can see that the sum converges to a constant value as n goes to ∞

5.7 Repeat the previous exercise by computing $X(k)$, $H(k)$ and $y(n)$ through FFT and IFFT.

Solution: The following python codes compute $X(k)$, $H(k)$ and $y(n)$ through FFT and IFFT.

```
from scipy.fft import fft, ifft
import numpy as np
import matplotlib.pyplot as plt

x=np.array([1.0,2.0,3.0,4.0,2.0,1.0])
x=np.pad(x,(0,8),'constant',constant_values
        =(0))
N=14
n=np.arange(N)
un=(-1/2)**n
hn1=np.pad(un,(0,2),'constant',
            constant_values=(0))
hn2=np.pad(un,(2,0),'constant',
            constant_values=(0))
hn=hn1+hn2

X=fft(x)
H=fft(hn[:N])
Y=np.zeros(N)+1j*np.zeros(N)
for i in range(N):
    Y[i]=X[i]*H[i]
y=ifft(Y)

plt.stem(range(0,N),np.real(X))
plt.title("Using_FFT")
plt.ylabel("$X(k)$")
plt.grid()
plt.show()

plt.stem(range(0,N),np.real(H))
plt.title("Using_FFT")
plt.ylabel("$H(k)$")
plt.grid()
plt.show()

plt.stem(range(0,N),np.real(y))
plt.title("Using_FFT_and_IFFT")
plt.ylabel("$y(n)$")
plt.grid()
plt.show()
```

5.8 Wherever possible, express all the above equations as matrix equations.

6 EXERCISES

Answer the following questions by looking at the python code in Problem ??.

6.1 The command

```
output_signal = signal.lfilter(b, a,
                               input_signal)
```

in Problem ?? is executed through the following difference equation

$$\sum_{m=0}^M a(m) y(n-m) = \sum_{k=0}^N b(k) x(n-k) \quad (6.1)$$

where the input signal is $x(n)$ and the output signal is $y(n)$ with initial values all 0. Replace **signal.filtfilt** with your own routine and verify.

6.2 Repeat all the exercises in the previous sections for the above a and b .

6.3 What is the sampling frequency of the input signal?

Solution: Sampling frequency(fs)=44.1kHz.

6.4 What is type, order and cutoff-frequency of the above butterworth filter

Solution: The given butterworth filter is low pass with order=2 and cutoff-frequency=4kHz.

6.5 Modifying the code with different input parameters and to get the best possible output.
